When my son was 4 years old he got a high fever, a cough, a runny nose and several body aches. He went to the hospital and had x-rays and a blood test which came back normal. The next day he started to cough up some thick, green mucus. The doctor gave him some antibiotics and sent him home. Three days later his fever returned and was accompanied by a bad cough. When he coughed the mucus would turn pink, frothy and clear, which we knew was not normal. The doctor sent him to the emergency room and when they examined him, they found that he had a red rash on his chest. The doctor told us that he thought our son was having an allergic reaction to something. The doctor gave him some antibiotics for the rash and sent him home with a prescription. The rash did not go away and the fever kept returning. Two weeks later he went back to the doctor, because his cough was getting worse and he was running a fever. This time the doctor sent him to the hospital. When the doctors did blood tests, they said that his WBC was high, and his Erythrocyte Sedimentation Rate (ESR) was high. They asked if our son had a heart condition, because he had what they called "heart murmur", which is a sound made by the blood rushing from one chamber of the heart to another. The doctor said that he thought our son was having an allergic reaction to something and sent him home with some more antibiotics and a follow up appointment in a week. Two days later our son came home and said that he had a bad headache and a lot of coughing. We took him to the emergency room because his headache was severe and he was running a fever. This time the doctor did a chest x-ray and gave him an echocardiogram. After the exam the doctor told us that he believed that our son had pneumonia. He said it was possible that our son was having an allergic reaction to something, because of the increased ESR. He said that he thought it was most likely a viral infection, but they would treat him for pneumonia. They gave him some antibiotics and sent him home. The next day his fever was back and his cough was still very bad. We took him back to the emergency room and he had a CAT scan. They said that our son's lungs were full of fluid and he had signs of pneumonia. They sent him to
